## **Abstracts**

Residential Boilers are enclosed metallic vessels which provide hot water and steam for various applications. Residential boilers transfer the heat to water which circulates through the radiators for heating purpose. Oil, natural gas and coal are commonly used fuel for combustion these units.

### **Scope of the Report:**

Many residential homes use boilers to heat water, and provide either hot water or steam for heating. Steam is distributed via pipes to steam radiators, and hot water can be distributed via baseboard radiators or radiant floor systems, or can heat air via a coil. Steam boilers operate at a higher temperature than hot water boilers, and are inherently less efficient.

The worldwide market for Residential Boiler is expected to grow at a CAGR of roughly xx% over the next five years, will reach 9330 million US\$ in 2023, from 9330 million US\$ in 2017, according to a new GIR (Global Info Research) study.
