According to our (Global Info Research) latest study, the global Residual Pressure Monitoring System for Firefighting market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

The residual pressure monitoring system for firefighting collects the residual pressure value between the smoke-proof staircase or the front room and the fire exit through the residual pressure detector, and uploads it to the residual pressure monitor through the non-polar two bus, and the monitor performs data analysis and processing. When the residual pressure exceeds the set range, the monitor sends out an audible and visual alarm signal and displays and prints the alarm location; at the same time, the monitor uses an algorithm to control the residual pressure monitor to adjust the angle of the air valve actuator in real time, and to control the side of the positive pressure air supply system. The opening and closing of the through valve ensures that the residual pressure value remains within a safe range.
