Abstracts

The global Residual Pressure Monitoring System for Firefighting market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The residual pressure monitoring system for firefighting collects the residual pressure value between the smoke-proof staircase or the front room and the fire exit through the residual pressure detector, and uploads it to the residual pressure monitor through the non-polar two bus, and the monitor performs data analysis and processing. When the residual pressure exceeds the set range, the monitor sends out an audible and visual alarm signal and displays and prints the alarm location; at the same time, the monitor uses an algorithm to control the residual pressure monitor to adjust the angle of the air valve actuator in real time, and to control the side of the positive pressure air supply system. The opening and closing of the through valve ensures that the residual pressure value remains within a safe range.

This report studies the global Residual Pressure Monitoring System for Firefighting production, demand, key manufacturers, and key regions.
