## Abstracts

A resin bearing is a bearing fabricated from a plastic material. Resin bearings are also called plastic bearings. A bearing is a component that receives the rotating shaft of a rotating device and facilitates its rotation. Since resin bearings are made of resin, they are lightweight and can be molded freely. They have high resistance to heat and chemicals, as well as high insulation properties, and can be used in special environments where metals are unsuitable.

Another advantage is that they do not require oil grease or other lubricants, so they require less frequent maintenance. The materials used for resin bearings are mainly synthetic resins, and since there are a wide variety of materials, the optimum material can be selected according to the application.

According to our (Global Info Research) latest study, the global Resin Bearing market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
