## Abstracts

Resin-infiltrated ceramic composite material is a composite material composed of ceramic particles and a resin matrix. The resin is impregnated into the gaps between the ceramic particles through resin infiltration technology, so that the ceramic particles and the resin matrix are closely combined, thus having the characteristics of a ceramic material. It has the characteristics of high hardness, high wear resistance and high temperature resistance, as well as the high toughness and easy processability of resin materials.

According to our (Global Info Research) latest study, the global Resin-Infiltrated Ceramic Composites market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.

Resin-infiltrated ceramic composites have broad application prospects in engineering and technical fields. Its unique combination of advantages, including the high hardness, wear resistance and high temperature resistance of ceramic particles, as well as the high toughness and easy processability of the resin matrix, makes it an ideal choice for solving various high-performance requirements.
