According to our (Global Info Research) latest study, the global Resistive Level Sensor market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

The 'Resistive Level Sensor' is a sensor used to measure the horizontal height of a liquid or the distance from the liquid surface to the bottom of a container. It is based on the principle of resistance change, and the level height is usually determined by measuring the effect of the level in the liquid on the resistance of the sensor. This type of sensor usually consists of two electrodes, one located near the surface of the liquid and the other at the bottom of the container, and the resistance value between the two electrodes changes as the liquid level changes.
