Abstracts

The global Resistive Level Sensor market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

The 'Resistive Level Sensor' is a sensor used to measure the horizontal height of a liquid or the distance from the liquid surface to the bottom of a container. It is based on the principle of resistance change, and the level height is usually determined by measuring the effect of the level in the liquid on the resistance of the sensor. This type of sensor usually consists of two electrodes, one located near the surface of the liquid and the other at the bottom of the container, and the resistance value between the two electrodes changes as the liquid level changes.
