A Resistive Lubrication System is a specialized lubrication system designed to provide controlled and consistent lubrication to machinery components through a resistive flow mechanism. In this system, lubricant is distributed to various points in the machinery via a network of resistive elements, such as metering valves or orifices, which regulate the flow rate based on the resistance they provide. This ensures that each component receives the appropriate amount of lubricant, preventing both over-lubrication and under-lubrication. Resistive lubrication systems are commonly used in applications where precise lubrication is essential, such as in high-speed machinery, automotive engines, and industrial equipment, to reduce friction, wear, and the risk of component failure. By maintaining optimal lubrication levels, these systems enhance the performance, reliability, and lifespan of machinery, while also minimizing maintenance requirements and operational costs.
