According to our (Global Info Research) latest study, the global Resolver Interface Module market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

The Resolver Interface Module (RIM) is a hardware device that is used in industrial automation systems to interface with resolver sensors. A resolver is a type of rotary electrical transformer that is commonly used to measure the position, speed, and direction of rotating machinery.

The RIM acts as an interface between the resolver sensor and the control system, converting the analog signals from the resolver into digital signals that can be processed by the control system. It typically includes signal conditioning circuitry to amplify and filter the resolver signals, as well as analog-to-digital converters to convert the signals into digital form.

The RIM may also include additional features such as fault detection and diagnostics, temperature compensation, and communication interfaces for connecting to the control system. It is typically mounted on a DIN rail or in a control cabinet and is connected to the resolver sensor through dedicated wiring.
