Abstracts

According to our (Global Info Research) latest study, the global Resonant Controller market size was valued at US\$ 163 million in 2024 and is forecast to a readjusted size of USD 205 million by 2031 with a CAGR of 3.4% during review period.

Resonant controllers include primary controllers for half-bridge topologies, designed to provide high efficiency under any load conditions, as well as high noise immunity. They implement a high voltage half-bridge driver that directly drives two power MOSFETs. The resonant controllers have a dedicated timing section to set soft start duration and minimum operating frequency.

A resonant controller is a type of controller commonly used in power electronics and control systems. It is commonly used in power electronics such as alternating current-direct current (AC-DC) converters, direct current-alternating current (DC-AC) inverters, and resonant direct current-direct current (DC-DC) converters. The main goal of the resonant controller is to achieve current or voltage resonance by controlling the resonant components in the circuit, thereby improving the efficiency and performance of power conversion. A resonant controller adjusts the resonant frequency at the input or output to match the frequency of the input or output signal for efficient energy transfer. Resonant controllers are commonly used in high-power, high-frequency power electronics applications, such as in renewable energy systems such as solar and wind inverters, electric vehicle chargers, and industrial high-frequency power supplies. Through resonant control, switching losses of switching devices can be reduced and higher power density and efficiency can be achieved.
