Abstracts

Resting tube for margarine enables the development of a network of crystals in fat to allow sufficient time for it to form and precipitate before being extruded into the packaging machine. The quiescent stage is important for the production cycle because it is where the product finally crystallizes. Without proper final crystallization, the consistency and properties of the product may be affected. The stationary tube provides sufficient time for the product to form and stabilize high-quality products every time. It has the advantages of large heat exchange area, low energy loss, increasing or reducing the number of tubes to increase or reduce the volume.
