NAD+ Anti-aging Intravenous Injection Therapy is an anti-aging and energy metabolism intervention therapy that delivers nicotinamide adenine dinucleotide (NAD+) directly into the bloodstream via intravenous injection. NAD+ is a key intracellular coenzyme involved in energy production, DNA repair, antioxidation, and metabolic regulation. Through intravenous injection, NAD+ concentrations in the body can be rapidly increased, promoting cell vitality and metabolism, thereby improving fatigue, cognitive function, and sleep quality, and potentially delaying aging and assisting in the treatment of chronic diseases. The upstream mainly involves NAD+ raw material manufacturers, pharmaceutical raw material suppliers, and injectable formulation manufacturers; the downstream targets medical aesthetic institutions, anti-aging clinics, rehabilitation centers, and high-end health management service providers. With the increasing demand for health management and precision medicine, NAD+ intravenous injection therapy is gradually becoming a popular project for high-end anti-aging and functional health interventions.
