Free-cutting steels are unalloyed or low-alloy quality steels that are known for their excellent machinability. They have an increased sulphur content and may also contain lead. The machinability of carbon steel containing up to about 0.5% carbon is improved by the addition of sulfur. Most resulfurized steels contain 0.08 to 0.13% sulfur, though some alloys allow sulfur content as high as 0.35%. The sulfur combines with manganese to form manganese sulfide (MnS) inclusions within the steel.
