According to our (Global Info Research) latest study, the global Retrieval-Augmented Generation market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Retrieval-Augmented Generation (RAG) is a natural language processing (NLP) model architecture that combines retrieval and generation techniques. In this architecture, the model first finds information (such as documents, sentences, etc.) related to the current task through a retrieval process, and then inputs this retrieved information as context into the generation model to produce more accurate and relevant text output. The purpose of this approach is to use the retrieved information to enhance the generation process so that it can generate content that is more in line with user intent and context.
