A Cavity Filter is type of RF filter that operates on the principle of resonance. Physically, it is a resonator with a “tuning screw” (to fine-tune the frequency) inside a “conducting box”. An RF or microwave resonator is a closed metallic structure (i.e., waveguides with both ends terminated in a short circuit). The resonator oscillates with higher amplitude at a specific set of frequencies, called resonant frequencies. When an RF signal passes through the cavity filter, a resonator acts as a band-pass filter and passes RF signals at particular frequencies (i.e., resonant frequencies) while blocking other nearby frequencies. The resonant frequency of the cavity resonator depends on its dimension (length, width, height), mode number, dielectric constant (ϵ_r), and magnetic permeability (μ_r) of the material of construction. In a cavity filter, the resonator is fitted with a screw to tune the frequency range which allows to modify the physical length (inner space length) of the resonator as well as its capacitance to the ground, hence tuning the resonant frequency.
