## Abstracts

According to our (Global Info Research) latest study, the global RF EAS Detection System market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

The RF EAS (Radio Frequency Electronic Article Surveillance) detection system is a security system used in retail stores or libraries to prevent theft. It combines RF technology with Electronic Article Surveillance (EAS) technology to track and prevent items from being stolen. The system consists of RF tags attached to items, RF readers placed at store exits or library exits, and an EAS detection system. RF tags contain unique identification information and can be detected by RF readers. EAS detection systems consist of antennas that create detection fields or doors at exit points. When a tagged item passes through the detection area, the RF reader reads the tag's information and sends it to the EAS detection system. If the item is not properly deactivated or authorized, an alarm is triggered, alerting store or library staff of a potential theft. RF EAS detection systems offer several benefits such as improved inventory management, reduced theft, enhanced customer experience, and increased operational efficiency. They track items in real time, automate the checkout process, and deter shoplifting.
