The global RFID Library Self-service Machine market size is expected to reach \$ 804 million by 2032, rising at a market growth of 4.3% CAGR during the forecast period (2026-2032).

RFID Library Self-service Machine is an intelligent unattended service terminal specially developed for library scenarios, which is equipped with professional RFID reading and writing modules, high-definition touch display, identity recognition devices and automatic printing components. It can independently complete book borrowing, returning, renewal, loss compensation payment and library card management services. It can identify multiple books in batches efficiently, realize seamless data linkage with library background management system, greatly reduce manual service pressure, shorten user business handling time, and is widely applicable to public libraries, university libraries and campus reading rooms.

In 2025, global RFID Library Self-service Machine production reached approximately 153 K units, with an average global market price of around US\$ 3,800 per unit. The production capacity of RFID Library Self-service Machine is approximately 193 K units per year, the average gross profit margin was 28-31%.

The upstream industry chain involves raw material suppliers providing electronic chips, RFID induction modules, display screens, industrial control mainboards, metal shells and auxiliary accessories, as well as technical service providers responsible for library management system docking development and embedded program research and development. Midstream manufacturers carry out finished equipment assembly, function debugging, performance aging test and unified function setting. Downstream links cover library equipment distributors, project integrators, education industry

procurement platforms and various library end users, and are matched with professional on-site installation, regular equipment maintenance, software iteration upgrade and fault repair supporting services.

The overall cost of RFID library self-service machines is mainly composed of core electronic hardware cost, among which RFID sensing and identification components occupy the largest proportion of expenditure. In addition, it includes industrial control equipment cost, human-computer interaction screen cost, structural shell processing cost, and customized secondary development cost for library system access. Meanwhile, assembly labor cost, product quality inspection cost, finished product transportation and deployment cost, after-sales service reserve cost and daily enterprise operation management cost are included. Different functional configurations, recognition sensitivity and equipment specifications will directly lead to obvious differences in total production cost.
