According to our (Global Info Research) latest study, the global Rhenium powders market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Rhenium is a chemical element; it has symbol Re and atomic number 75. It is a silvery-gray, heavy, third-row transition metal in group 7 of the periodic table. With an estimated average concentration of 1 part per billion (ppb), rhenium is one of the rarest elements in the Earth's crust. It resembles manganese and technetium chemically and is mainly obtained as a by-product of the extraction and refinement of molybdenum and copper ores. Rhenium has the highest density, second only to platinum, iridium and osmium. It has the highest purity and consistent certified product quality, and only tungsten and carbon have higher melting points than rhenium. Rhenium has good wear resistance and is able to resist arc corrosion. It is soluble in nitric acid and sulfuric acid. This report focuses on rhenium powder. Rhenium powder is a light gray metal powder made of aggregated single crystals.
