Abstracts

The global Ribavirin Injection market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Ribavirin Injection is a clinically commonly used broad-spectrum antiviral drug. Ribavirin, the main component of Ribavirin injection, can inhibit the synthesis, replication and transmission of respiratory syncytial virus, adenovirus, hepatitis virus, measles virus, influenza virus, herpes virus and other viruses. Ribavirin inhibits viral growth by entering virus-infected cells and blocking viral RNA and protein synthesis, thereby inhibiting viral growth and transmission. It can also inhibit the spread of the virus by neutralizing antibodies through immune mechanisms. Currently, Ribavirin injection is widely used in clinical patients with respiratory syncytial virus infection or other viral infections of the respiratory system. In addition, it can also be used as adjuvant therapy for patients infected with hepatitis A and hepatitis C virus. In addition, it is also used in some patients with viral infectious diseases such as chickenpox, measles, herpes simplex and epidemic hemorrhagic fever.
