Rice husk silica generator or production equipment refers to special machinery for extracting high-purity silicon dioxide (silicon dioxide, SiO₂) from rice husks, an agricultural byproduct. The process typically involves controlled burning of rice husks at high temperatures (500-800°C) to remove organic matter, followed by an acid leaching or purification step to eliminate impurities such as alkali metals. The resulting silica is a fine amorphous powder that can be used in industries such as rubber, concrete, electronics and sustainable materials. The equipment converts waste rice husks, which are usually discarded or burned in the open air, into a valuable resource, which not only solves environmental pollution problems but also meets the growing demand for environmentally friendly silica resources. Its sustainable approach supports circular economy principles by converting agricultural waste into industrial-grade materials.
