Abstracts

The global Rice Milling market size is expected to reach \$ 1974 million by 2032, rising at a market growth of 4.9% CAGR during the forecast period (2026-2032).

Rice Milling are grain processing machines used to convert paddy rice into edible rice by cleaning, destoning, husking, paddy separation, whitening, polishing, grading, color sorting and packing. These machines remove husk, bran layer, germ, broken rice and impurities to produce different grades of white rice, brown rice or polished rice. In a narrow sense, rice milling machines mainly refer to whitening machines such as abrasive rice whiteners, friction rice whiteners and vertical rice mills; in a broader sense, they also include small combined rice mills, commercial milling units and fully automated rice processing plants. In 2025, the average price of Rice Milling Machines was approximately USD 5,000 per unit/set, and the industry's average gross margin was around 32%.

The demand for Rice Milling Machines is mainly driven by stable global rice consumption, large-scale rice processing, food security investment, agricultural processing upgrades and rising labor costs. In major rice-producing regions across Asia, Africa and Latin America, small local milling operations are increasingly being upgraded into medium and large centralized processing plants, creating demand for cleaning, husking, whitening, polishing, grading and color sorting equipment. At the same time, higher requirements for head rice yield, whiteness, gloss, low broken rate and food safety are increasing demand for high-capacity, low-breakage, energy-efficient, intelligent and integrated rice milling systems. Policies supporting grain loss reduction, agricultural mechanization, storage-processing integration and export-grade rice processing capacity are also pushing the industry from traditional standalone machines toward automated, digital and turnkey plant solutions.

This report studies the global Rice Milling production, demand, key manufacturers, and key regions.
