## Abstracts

According to our (Global Info Research) latest study, the global Rigid Borescopes market size was valued at USD 88 million in 2023 and is forecast to a readjusted size of USD 105 million by 2030 with a CAGR of 2.6% during review period.

A borescope (occasionally called a boroscope, though this spelling is nonstandard) is an optical device consisting of a rigid or flexible tube with an eyepiece or display on one end, an objective lens or camera on the other linked together by an optical or electrical system in between. The optical system in some instances is surrounded by optical fibers used for illumination of the remote object. An internal image of the illuminated object is formed by the objective lens and magnified by the eyepiece which presents it to the viewer's eye.

Rigid or flexible borescopes may be fitted with an imaging or video device. For medical use, similar instruments are called endoscopes. Rigid borescopes are similar to fiberscopes but generally provide a superior image at lower cost compared to a flexible borescope. Rigid borescopes have the limitation that access to what is to be viewed must be in a straight line. Rigid borescopes are therefore better suited to certain tasks such as inspecting automotive cylinders, fuel injectors and hydraulic manifold bodies, and gunsmithing.
