Abstracts

The global Rim Driven Thruster market size is expected to reach \$ 545 million by 2032, rising at a market growth of 4.1% CAGR during the forecast period (2026-2032).

The rim driven thruster is an advanced electric direct-drive ship thruster. It is a new type of ship thruster product. The rim motor directly drives the propeller without any transmission link in the middle. It has high efficiency, low noise and high reliability. , compact and lightweight advantages.

The upstream core lies in high-performance materials and precision components, including high-energy-density permanent magnet materials, ultra-thin composite materials resistant to seawater corrosion, ceramic bearings, and core power drive modules.

Global sales are projected to be approximately 158,000 units in 2025, with market prices ranging from \$1,000 to \$6,000. Industry gross profit margins are expected to be in the 25%-40% range.

The core driving factors for the industry's development mainly come from three aspects. First, there is the strong impetus from global energy conservation and emission reduction policies. For example, China has listed rim-driven thrusters as an encouraged industry and has introduced targets for green inland waterway vessel construction and single-ship subsidy policies, providing direct impetus for technology promotion.

Second, continuous breakthroughs in technological innovation have occurred. The rim-driven propulsion devices developed through collaboration between domestic enterprises and research institutions have eliminated the traditional transmission shaft system, achieving integrated engine and propeller design, significantly improving

propulsion efficiency and reliability.

Thirdly, market demand is expanding. With the rapid growth of the electric ship market and the increasing demand for low-noise, high-maneuverability propulsion systems in high-end vessels such as luxury cruise ships and oceanographic research vessels, the application scope of rim-driven thrusters is continuously expanding.

As an advanced electric direct-drive ship propulsion technology, rim-driven thrusters are considered an important development direction in the field of ship electric propulsion due to their compact structure, high power density, low noise and vibration, and easy maintenance, leading to a positive long-term market outlook.
