## Abstracts

According to our (Global Info Research) latest study, the global Robot Hub Motor market size was valued at US\$ 621 million in 2025 and is forecast to a readjusted size of US\$ 1886 million by 2032 with a CAGR of 17.4% during review period.

The robot hub motor is a drive device that integrates the motor directly into the wheel hub of the robot wheel, without the need for traditional transmission parts, and directly drives the wheel to rotate. The robot hub motor has obvious advantages, such as small size, simple structure, fast power response, low cost, and easy installation.

The market for robot hub motors is driven mainly by the rapid growth in automation and intelligence demands, especially in the fields of industrial AGV/AMR, service robots, and new energy electrification. Its high integration, lightweight, and high-efficiency characteristics make it an ideal drive solution. At the same time, emerging applications such as unmanned delivery and medical robots have further expanded the market space. However, the technology still faces significant challenges, including thermal management problems, design bottlenecks of small size and high power density, high manufacturing costs, and reliability issues in complex environments. In addition, supply chain dependence and lack of standardization also limit large-scale applications. Despite these obstacles, with the advancement of material innovation and control algorithms, the penetration rate of hub motors in the field of robotics is expected to continue to increase.
