According to our (Global Info Research) latest study, the global Robot-joint Electromagnetic Brake market size was valued at US\$ 218 million in 2025 and is forecast to a readjusted size of US\$ 436 million by 2032 with a CAGR of 10.8% during review period.

A robot-joint electromagnetic brake is an electrically actuated braking module integrated into a robot joint (motor/gearbox/actuator drivetrain) to stop and hold the joint/axis?especially under power loss, E-stop, or control faults?preventing drift or gravity back-drive. In 2025, global robot-joint electromagnetic brake production reached approximately 11,029.53 k units. Global production capacity in 2025 is approximately 1,300 k units. Upstream for robot-joint electromagnetic brakes includes structural & friction materials (steel/aluminum parts, friction linings, springs, fasteners), electromagnetic/electrical materials (copper coils, insulation, connectors/cables), and?depending on design?permanent magnets plus bearings/seals. Downstream, these brakes are commonly integrated into robot joint modules / integrated actuators (e.g., harmonic/planetary gear + frameless torque motor + encoder + brake) and delivered to industrial/collaborative robot OEMs and safety-critical automation axes, where the brake?s job is to hold the arm in position under power loss or faults to prevent back-drive, drop, or drift.

Robot-joint electromagnetic brakes are critical safety components integrated into robot joints and joint actuators, designed to provide rapid holding and position locking in the event of power loss, emergency stop, or control failure. Their primary function is to prevent joint back-driving, arm drop, or uncontrolled motion caused by gravity or inertia. The mainstream technical architecture is spring-applied, electrically released (power-off

fail-safe) braking, which has become a standard configuration in industrial robots, collaborative robots, and emerging humanoid robots. Current demand is driven mainly by gravity-loaded axes in industrial robots and full-joint safety holding requirements in collaborative robots, while emerging applications such as humanoid and service robots are accelerating demand for slim, hollow-shaft, high-reliability brake designs.
