According to our (Global Info Research) latest study, the global Robot Safety Controller market size was valued at US\$ 506 million in 2025 and is forecast to a readjusted size of US\$ 818 million by 2032 with a CAGR of 6.9% during review period.

A robot safety controller is a dedicated functional-safety control unit used in industrial robots, collaborative robots, mobile robots and robotic workcells. It typically combines safety processors, safe I/O, certified communication interfaces, configurable or programmable safety logic, diagnostic tools, redundancy mechanisms and safety-rated outputs to implement safety functions such as emergency stop, safeguard stop, safe speed monitoring, safe position monitoring, safe zone supervision, mode selection, enabling-device control and safe restart. In robotic applications, the controller evaluates signals from safety devices such as interlock switches, light curtains, laser scanners, safety mats, enabling switches, encoders, drives and robot controllers, and commands the robot or surrounding machinery into a defined safe state when a hazardous condition is detected. This study focuses on functional-safety controllers used for robotic applications, including standalone safety PLCs, programmable safety controllers, configurable safety controllers, embedded robot safety options, cobot safety modules, AMR/AGV safety control boards and associated safety configuration software.

Based on our research, the robot safety controller market should be understood as a functional-safety control layer rather than a single product category. It includes standalone safety PLCs, programmable safety controllers, configurable safety controllers, robot-controller embedded safety options, cobot safety functions and safety control boards for mobile robots. The underlying safety technology is mature, supported by standards such as IEC 61508, ISO 13849 and ISO 10218, but the application

structure is still evolving. Conventional fenced robot cells continue to use external safety PLCs and safety controllers, while collaborative robots, flexible production cells, AMRs and human-robot interaction scenarios require more integrated safety logic, safe zone supervision, safe speed and position monitoring, and safety-rated communication. The value proposition is therefore shifting from simple shutdown logic to verifiable, diagnosable and configurable safety behavior control.

Demand is driven by both new robot installations and the safety upgrading of existing robotic lines. Automotive, electronics, battery manufacturing, photovoltaics, metalworking, food and packaging, warehouse automation and general manufacturing are the main application clusters. Asia provides the largest volume base due to high robot deployment, while Europe and North America are more influenced by compliance, retrofits, flexible manufacturing and collaborative-cell upgrades. Collaborative robots and mobile robots do not eliminate the need for safety controllers; instead, they change the product architecture toward embedded safety, dynamic zone management, safe speed and position supervision, and certified communication between robot, drive, sensor and controller.

From a technology-roadmap perspective, the industry is moving from cabinet-centric safety PLCs toward distributed safety control, integrated safe I/O, safety motion, and embedded safety computing platforms. Safety protocols such as PROFIsafe, CIP Safety and FSoE are becoming important enablers because they allow safety-related data to move across standard industrial networks while preserving certified behavior. At the same time, AMR and cobot applications require compact hardware, deterministic response, easier validation and certified software stacks. The activities of Asian suppliers such as Delta and NexCOBOT suggest that the competitive landscape is gradually broadening from traditional European, Japanese and U.S. leaders to regional functional-safety platforms and robot-specific embedded solutions.
