## Abstracts

According to our (Global Info Research) latest study, the global Robotic Electrostatic Spray Gun market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Electrostatic spraying is to charge the product with positive electronic, paint is charged with negative electronic. So it forms a high voltage electrostatic field between spray gun and product. When paint leaves the nozzle, it gets a charge at its edge then further atomized into tiny negatively charged particles. According to the principle of homosexual repelling and opposite-sex attraction, the negatively charged paint particles are sucked into the object under the action of the electrostatic field, uniformly adsorbed onto product surface then discharge the electronics to complete coating
