Abstracts

The global Robotic Electrostatic Spray Gun market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Electrostatic spraying is to charge the product with positive electronic, paint is charged with negative electronic. So it forms a high voltage electrostatic field between spray gun and product. When paint leaves the nozzle, it gets a charge at its edge then further atomized into tiny negatively charged particles. According to the principle of homosexual repelling and opposite-sex attraction, the negatively charged paint particles are sucked into the object under the action of the electrostatic field, uniformly adsorbed onto product surface then discharge the electronics to complete coating
