Abstracts

According to our (Global Info Research) latest study, the global Robotic Photogrammetry Software market size was valued at US\$ 139 million in 2025 and is forecast to a readjusted size of US\$ 288 million by 2032 with a CAGR of 10.9% during review period.

Robotic photogrammetry software utilizes images captured by drones or robots to automatically generate 3D models, digital surface models (DSMs), orthophoto maps (DOMs), etc., and is widely used in surveying, architecture, archaeology, agriculture, and other fields. Robotic photogrammetry combines automation hardware with image processing algorithms for applications such as high-precision industrial inspection, digital twinning, and robot path planning. Its gross profit margin is approximately 60%-75%, significantly affected by technological complexity and scenario requirements.

Key market drivers include the following:

First, growth in the robotic photogrammetry software market is driven by the rising need for robot perception, localization, and 3D reconstruction. Mobile robots, industrial robots, inspection robots, and surveying robots require an accurate understanding of their operating environments and must convert image data into spatial coordinates, 3D models, or measurement results. Photogrammetry software enables target recognition, spatial reconstruction, dimensional measurement, and position calibration based on multi-view imagery, providing the data foundation for autonomous navigation, path planning, and task execution.

Second, the development of industrial automation and digital twins is driving the

expansion of photogrammetry software from the surveying sector into robotics applications. Manufacturing plants, construction sites, mines, power facilities, and large-scale equipment sites all require efficient spatial data acquisition; traditional manual measurement methods are inefficient and difficult to update continuously. By equipping robots with cameras, depth sensors, or multi-sensor modules, automated data collection and modeling can be achieved via photogrammetry software, helping enterprises improve efficiency in inspections, acceptance testing, construction management, and asset management. Furthermore, the declining costs of AI vision algorithms, computing platforms, and sensors have enhanced the commercial viability of robotic photogrammetry software. Such software is evolving beyond mere post-processing tools; it is increasingly integrating with robot control systems, SLAM algorithms, cloud-based modeling platforms, and industry-specific application systems. Future market competition will center on modeling accuracy, processing speed, adaptability to low-texture environments, multi-sensor fusion capabilities, and industry-specific scenario templates, giving a distinct advantage to companies capable of providing integrated hardware-software solutions.
