Abstracts

According to our (Global Info Research) latest study, the global Robots Electric Grippers market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Electric grippers are a type of robotic end-effector that use electric motors to control the opening and closing of the gripper fingers. These grippers are commonly used in industrial automation applications, where they can be used to pick up and move objects in manufacturing and assembly processes.

Electric grippers offer several advantages over other types of grippers, such as pneumatic or hydraulic grippers. One advantage is that they are typically quieter and more precise, allowing for more precise positioning of objects. They are also generally more energy-efficient, which can lead to cost savings over time.

There are several different types of electric grippers, including parallel grippers, which have two fingers that move parallel to each other to grasp objects, and angular grippers, which have fingers that move at an angle to each other to grip objects with irregular shapes.

In addition to electric grippers, there are also other types of robotic end-effectors, including vacuum grippers, magnetic grippers, and tool changers. The choice of end-effector will depend on the specific application and the requirements of the task at hand.
