## Abstracts

Rock bolts are threaded steel bars that are used to secure potentially unstable blocks on the face of a rock cut. The process involves drilling through the unstable block and into more competent rock beyond the failure surface. The steel bar is then inserted into the hole and grouted into place using a cement based grout. In some applications, only the bottom portion of the rock bolt is grouted to create a bonded and un-bonded zone. This allows for the rock bolt to be tensioned against the unstable block resulting in active pressure to hold the mass in place.
