Abstracts

The global Rod End Joint Bearing market size is expected to reach \$ 2283 million by 2032, rising at a market growth of 6.4% CAGR during the forecast period (2026-2032). Global sales of rod end joint bearings reached 337 million units in 2025, with an average price of \$4,263 per thousand units.

A rod end bearing is a common type of mechanical joint used on the ends of control rods. The steering columns in most cars, trucks and other vehicles, for example, feature tie rods with a rod end bearing. Of course, tie rods are designed to connect a vehicle's steering rack to its steering knuckle.

The raw materials for rod end joint bearings consist of three parts: housing, ball joint, and sliding layer. The housing is generally made of 45# carbon structural steel or 42CrMo alloy steel bar, with a tensile strength ≥ 600 MPa after tempering. The ball joint is made of GCr15 bearing steel, integrally hardened and surface-plated with hard chrome. Maintenance-required sliding layers often use copper alloy (steel-copper) or steel-to-steel, while maintenance-free types use sintered PTFE copper film or injection-molded PTFE glass fiber composite material. Raw materials account for 55-60% of the ex-factory price, with shell steel bars accounting for approximately 30%, joint ball bearings approximately 15%, and copper retainer/PTFE composite materials approximately 10%. Machining, milling, tempering, chrome plating, injection molding/sintering, and other processing and testing costs account for 25-30%. Therefore, raw material prices have the greatest impact on cost elasticity.
