Abstracts

The global Rodent Control market size is expected to reach \$ 14444 million by 2032, rising at a market growth of 5.3% CAGR during the forecast period (2026-2032).

Rodent Control (or Rodent Management) is the systematic practice of preventing, managing, and eliminating infestations of rats, mice, and other rodents from residential and commercial. Within the framework of Integrated Pest Management (IPM), modern rodent control transcends mere extermination; it integrates exclusion (sealing entry points), sanitation (removing food and water sources), and lethal methods (trapping and baiting). By 2026, the industry has heavily adopted Digital Monitoring Systems (IoT) to detect activity in real-time, ensuring a data-driven approach that minimizes the impact on human health, property integrity, and environmental safety.

The global market for rodent control is expected to maintain stable growth in the future. Major global companies of Rodent Control include Rentokil Initial, Rollins, Anticimex, Ecolab, BASF, etc. In 2025, the world's top three vendors accounted for 32.64% of revenue.

The global rodent control market is a stable and steadily growing segment of the pest control industry, driven by urbanization, expanding food supply chains, and rising hygiene and food safety standards. Demand exists across residential, commercial, industrial, and logistics environments, but is most consistent in commercial sectors such as food processing, warehousing, restaurants, and retail distribution. Because rodent control is directly tied to public health and food safety, it behaves as a largely non-discretionary and recurring service.

Growth is mainly supported by increasing urban density and the concentration of food

and goods in large storage and distribution systems, which create favorable conditions for rodent activity. At the same time, stricter food safety regulations and higher operational standards in hospitality and retail are pushing businesses toward continuous pest management rather than reactive treatments. Climate factors in many regions also contribute to sustained rodent population pressure.

The industry is gradually shifting from traditional chemical-heavy approaches to more integrated pest management solutions. Mechanical traps, monitoring systems, and sensor-based technologies are becoming more common, especially in commercial applications. Service models are also evolving toward recurring contracts, where prevention and monitoring replace one-time extermination as the core value proposition.

Regulation is tightening in developed markets, particularly around chemical rodenticides and environmental safety, encouraging the adoption of lower-toxicity solutions and alternative control methods. While this increases compliance costs, it also drives innovation and raises barriers to entry.

Regionally, Asia-Pacific is the largest growth market, led by China and Southeast Asia, supported by rapid urbanization and infrastructure expansion. North America and Europe are mature markets with high service penetration and established recurring revenue models. Latin America shows moderate growth driven by urbanization and retail expansion, while the Middle East and Africa remain smaller but unevenly developing regions.

In conclusion, the rodent control market is evolving from a fragmented, reactive industry into a more structured, service-driven ecosystem. Growth is moderate but resilient, supported by its essential role in food safety and urban infrastructure, with long-term value increasingly concentrated in companies that integrate products, services, and digital monitoring into recurring management systems.
