A roll to roll embossing machine is a specialized machine used to emboss patterns or textures onto continuous rolls of material such as paper, film, foil, fabric or plastic. This process is widely used in industries that require large-scale surface finishing to add decorative and functional textures to materials. The working principle of a roll to roll embossing machine is based on the roll-to-roll process, whereby a cylindrical roll of material (usually film or flexible board) is rolled out, and then application-specific features are added to the flexible board or the surface of the board is processed (e.g., embossed), and the processed board is then rolled into a cylindrical shape or cut. The embossing process is usually realized by embossing the feature shape on the circumferential surface of the roller directly onto the surface of the flexible board.
