Abstracts

The global Roller Guide Block market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The roller guide block is a precision linear rolling guide with high load capacity and high rigidity. It can reduce the weight of the whole machine and the cost of the transmission mechanism and power when the reciprocating motion frequency of repeated actions, starting and stopping is high. . Roller guide blocks can achieve high sensitivity and high-performance planar linear motion. In the case of heavy load or variable load, the elastic deformation is small and smooth linear motion can be obtained without crawling. The roller guide block can improve the positioning accuracy of the machine because its rolling body, the roller, is well-guided when rolling and can be automatically centered. The rollers in the roller guide block move circularly in the matrix, so the use of the rolling guide block is not limited by the length of the machine bed, and the number of guide rail blocks can be determined according to the size of the load and the selected specifications. Roller guide blocks have a wide range of applications. Small ones can be used on linear motion components such as molds and instruments, while large ones can be used for plane linear motion of heavy machine tools and precision instruments, especially for NC and CNC machine tools.
