## Abstracts

The global Rolling Contact Fatigue Testing Machine market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The rolling contact fatigue testing machine is a device used to test the fatigue life and performance of rolling contact components such as bearings, gears, racks, chains, etc. It can simulate reciprocating rolling stress under actual working conditions and subject materials and products to long-term cyclic loading to evaluate their fatigue life and reliability. Rolling contact fatigue testing machines usually consist of a spindle, drive system, load system, control system, data acquisition system, etc. During the test, the sample is installed on the spindle and rotates and reciprocates through the drive system. The load system applies reciprocating rolling stress to the sample, and the control system controls the test parameters and collects test data.
