Abstracts

The global Rootstock Cutting Machine market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The rootstock cutter is an agricultural machine used to reproduce plants, especially fruit trees, by removing cuttings from the rootstock to produce new plants. The machine is designed to perform clean and accurate cutting on the rootstock, and then transplant the required scions onto the rootstock. The machine typically consists of a conveyor belt that moves the rootstock towards the cutting blade. The rootstock is then cut to the desired length, typically about 10-20 centimeters, and the cuttings are collected in a trash can or another conveyor belt. Rootstock cutting machines are used in nurseries, orchards, and other agricultural environments to reproduce fruit trees such as apple, pear, and peach trees.
