A rotary brush filter is a device used to separate and filter solid impurities from liquids during food processing. Its design usually includes one or more rotating brush rollers surrounded by a filter screen or other filter media. The working principle of the device is that when the liquid flows through the filter media, impurities are captured and clean liquid passes through. Due to the rotating motion of the brush, the trapped impurities are brushed away, so that the liquid can be filtered continuously and effectively without frequent filter screen replacement or complex cleaning operations.
