The global Rotary Sieve Machine market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A rotary sieve machine is a mechanical device used to separate particles of different sizes by using a cylindrical mesh or screen that rotates on an axis. The material to be sifted is fed into the sieve at the top and as the sieve rotates, the particles smaller than the mesh size pass through the mesh and fall through a discharge chute, while the larger particles are retained on the mesh and carried to the end of the sieve.
