According to our (Global Info Research) latest study, the global Rotational Excisional Atherectomy System market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

The rotational excisional atherectomy system is a new treatment method that dredges blood flow by removing atherosclerotic plaques that cause arterial stenosis or blockage. Peripheral vascular plaque removal consists of a catheter containing an alloy blade and a power driver. During the operation, the doctor pushes the catheter with an alloy blade through the puncture port to the site of vascular lesions, turns on the power driver and the switch at the proximal end of the catheter, pushes a small carbon alloy cutting blade, and slowly and evenly pushes the catheter through the lesion site. The plaque on the blood vessel wall is cut off, and the doctor can cut multiple times along different directions of the blood vessel. After the cutting is completed, the catheter and the plaque stored at the catheter tip can be removed from the body, and an unobstructed blood vessel channel can be obtained.
