According to our (Global Info Research) latest study, the global Rotor Kite market size was valued at US\$ 29.3 million in 2024 and is forecast to a readjusted size of USD 38.9 million by 2031 with a CAGR of 4.1% during review period.

The characteristic of rotor kites is their 'rotor' design. This kind of kite is usually equipped with a finely processed skeleton, which is covered with a thin material (such as nylon silk) to form blades similar to helicopter rotors. These rotor blades are connected to the main body of the kite by ropes and play a key role in the flight of the kite. The flying principle of rotor kites is different from that of ordinary kites. It mainly relies on wind power and uses the rotation of the rotor to generate lift. When the kite is released and receives enough wind, the rotor will start to rotate. This rotation not only helps the kite maintain stability, but also generates additional lift through aerodynamic effects, allowing the kite to rise to a higher altitude.
