Abstracts

According to our (Global Info Research) latest study, the global Rotor Multi-flow Wet Remote Transmission Water Meter market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

The rotor multi-flow wet-type remote transmission water meter is a water metering instrument that can realize remote meter reading, charging and control functions through Internet of Things technology. Its structure mainly consists of a rotor-type multi-flow water meter and an electronic controller. Its principle is that the water flow tangentially impacts the impeller from the water inlet of the watch case to rotate it, and then continuously records the number of revolutions of the impeller through the gear reduction mechanism, thereby recording the flow. The cumulative flow rate of the water meter. The difference between the rotor multi-flow wet remote water meter and the rotor single-flow wet remote water meter is that the former uses the distribution function of the impeller box to tangentially impact the multi-stream water flow from the water inlet of the impeller box to the impeller, causing the water flow to impact the impeller axially. The forces are balanced, the wear of the impeller support part is reduced, and the impact of water meter installation and scaling on water meter errors is structurally reduced. The overall performance is significantly higher than the latter. The difference between the rotor multi-flow wet-type remote transmission water meter and the rotor-type remote transmission water meter is that the impeller rotation direction of the former is vertically related to the direction of the water flow, while the rotation direction of the impeller and the direction of the water flow are horizontally related to the latter. The former is suitable for measuring the total water flow in small-diameter pipes, and the latter is suitable for measuring the total water flow in large-diameter pipes. The former

has relatively high measurement accuracy, while the latter has relatively large circulation capacity.
