Abstracts

Robotic process automation (or RPA or RPAAI) is an emerging form of business process automation technology based on the notion of software robots or artificial intelligence (AI) workers.

In traditional workflow automation tools, a software developer produces a list of actions to automate a task and interface to the back-end system using internal application programming interfaces (APIs) or dedicated scripting language. In contrast, RPA systems develop the action list by watching the user perform that task in the application's graphical user interface (GUI), and then perform the automation by repeating those tasks directly in the GUI. This can lower the barrier to use of automation in products that might not otherwise feature APIs for this purpose.

Scope of the Report:

This report focuses on the RPA in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

The role of technology is evolving continuously at a faster pace. The last few decades witnessed various waves of technology progression that significantly impacted business growth. Few of these technologies are now declining as businesses globally are transforming into a dynamic digital environment. However, RPA is anticipated to evolve and soar over the forecast period. The modern enterprise demand RPA technology to be fast in implementation, execution, and scaling. It alleviates human workers of their mundane and repetitive daily tasks by processing workflow much quicker and subsequently more efficiently.

The worldwide market for RPA is expected to grow at a CAGR of roughly 61.8% over the next five years, will reach 4750 million US\$ in 2023, from 260 million US\$ in 2017, according to a new GIR (Global Info Research) study.
