According to our (Global Info Research) latest study, the global Rubber Belt Vacuum Filter market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

The rubber belt vacuum filter is a piece of equipment specially used for solid-liquid separation. It can perform efficient solid-liquid separation under vacuum. This kind of equipment usually consists of rubber conveyor belt, vacuum system, filter area, cleaning area and other parts. During the working process, the suspension is first pumped to the filter area. Under the action of the vacuum system, the rubber belt forms a film-like filter material layer on the filter area. After the suspension passes through the filter material layer, the solid particles are trapped in the filter area. rubber belt surface, and the filtered liquid is pumped away through the vacuum system. Subsequently, the rubber belt will pass through the cleaning area to clean the solid particles remaining on it, and finally form a dry solid product.

The rubber belt vacuum filter has the characteristics of high efficiency, energy saving, and high degree of automation. It can achieve a rapid and continuous solid-liquid separation process, and can handle suspensions with high suspended solid concentrations. It plays an important role in industrial production.
