Salary benchmarking software is a tool used to determine and set salary levels for employees within and outside an organization. This type of software usually combines market research data, industry standards and internal organizational data to help companies formulate and adjust employee salary levels to remain competitive, motivate employees and maintain the organization's salary structure and fairness.

The payroll benchmarking software market is moving towards data-driven, automated, and globalized solutions. Growing corporate demands for payroll transparency, internal comparisons, and market benchmarking are driving the evolution from static payroll tables to dynamic benchmarking engines and real-time updated solutions. Vendors typically offer market data collection, regional/industry comparisons, payroll structure modeling, position-level analysis, compliance and privacy protection, and deep integration with Human Resources Information Systems (HRIS) and recruitment/performance modules. With the diversification of data sources (public data, industry databases, internal payroll history, etc.), cloud deployment, and increasing observability requirements, market competition is characterized by a strong coexistence of standardization and personalized customization, and pricing models are trending towards subscription-based systems and tiered pricing based on data volume/coverage.
