Sandwich Panel for Ships is a composite material structure consisting of two thin panels with a thicker lightweight core material (such as foam plastic, honeycomb structure, balsa wood, etc.) in between. The panels provide strength and rigidity, while the core material reduces weight, insulates heat and sound, and improves bending rigidity and stability. This structure is also called a 'sandwich structure'. The panels and core material are combined by gluing or mechanical connection to form a lightweight and high-strength material with good integrity, which is widely used in ship construction.
