According to our (Global Info Research) latest study, the global Satellite-based Automatic Identification Systems market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

The S-AIS is a very high-frequency automatic vessel tracking system that provides location information to ships and shore stations through electronic exchange of data regarding position, identification, course, and speed. AIS enables two-way communication between coastal authorities and several vessels using satellite communication technology.

The Class A transponder segment will dominate the market during the forecast period. Much of this segment's growth is primarily due to the ability of these transponders to transmit information more frequently and detect vessels even in dense areas. Several commercial vessels carrying expensive commodities are installing Class A transponders to achieve high traceability and better monitoring and controlling features. The increase in the number of larger vessels in maritime traffic and decrease in the price of transponders will augment the growth of this segment during the forecast period.
