Abstracts

According to our (Global Info Research) latest study, the global Saturated Rubber market size was valued at US\$ 18430 million in 2024 and is forecast to a readjusted size of USD 22580 million by 2031 with a CAGR of 3.0% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Saturated rubber refers to rubber without unsaturated bonds in its main chain, that is, the carbon atoms in the rubber molecular chain are connected by single bonds, and there are no unsaturated bonds such as double bonds or triple bonds. This structure makes saturated rubber have more stable chemical properties and can resist the erosion of various chemicals and environments. Saturated rubber is usually made of saturated hydrocarbons, and its raw materials are mainly derived from hydrocarbon compounds such as petroleum and natural gas, and are made through polymerization reactions. Compared with traditional natural rubber and some synthetic rubbers, saturated rubber has better heat resistance, oil resistance, chemical resistance and weather resistance. These characteristics make saturated rubber widely used in many fields, such as automobile manufacturing, aerospace, construction, electronics and other fields, for the manufacture of various seals, shock absorbers, pipelines, wire and cable insulation layers, etc. Common types of saturated rubber include chloroprene rubber, ethylene propylene diene monomer rubber (EPDM), acrylic rubber (ACM), etc. These rubber materials have different characteristics and uses, and can be selected according to specific application requirements.
