A Saturation Diving Chamber is a specialized pressurized environment used in deep-sea diving operations to allow divers to live and work at great depths for extended periods. In saturation diving, the chamber maintains the same pressure as the underwater work site, enabling divers to stay in a pressurized state for days or weeks without undergoing repetitive decompression. The chamber is connected to the diving bell, which transports divers to and from the work site while maintaining constant pressure. Once the dive mission is complete, the divers undergo a single, controlled decompression in the chamber, which can take several days, reducing the risk of decompression sickness ('the bends'). Saturation diving chambers are used in underwater construction, oil and gas exploration, and salvage operations at significant depths.
