The global SBP-BF4 market size is expected to reach $ 101 million by 2032, rising at a market growth of 7.1% CAGR during the forecast period (2026-2032).

SBP-BF4 (Spiro-(1,1')-bipyrrolidinium tetrafluoroborate) is an advanced quaternary ammonium salt commonly used as a high-performance electrolyte in energy storage devices like supercapacitors and batteries.

In 2025, global SBP-BF4 production reached 690 metric tons, with an average selling price of $88 per kilogram and a total production capacity of approximately 1,000 metric tons. The gross margin is approximately 40%?55%. In terms of cost structure, direct materials account for about 70%, manufacturing overhead accounts for about 25%, and labor costs account for about 5%. In the industry chain, upstream materials include spiro quaternary ammonium salt precursors, tetrafluoroboric acid/tetrafluoroborates, and refined solvents; downstream applications mainly include electric double-layer capacitors (EDLCs)/supercapacitors and related products.
Global attention on SBP-BF4 (spiro-bipyrrolidinium tetrafluoroborate) continues to rise alongside the demand for high-voltage, long-cycle-life lithium-ion batteries. Based on official websites and annual reports of major electrolyte and lithium salt producers, several leading companies have incorporated this material into their R&D pipelines for high-voltage electrolytes and are advancing large-scale production. Technically, SBP-BF4 demonstrates notable effectiveness in suppressing gas evolution and improving high-temperature cycling stability, which accelerates its adoption in power batteries and energy storage systems. On the supply side, only a limited number of players can achieve stable, high-purity mass production; process control and impurity removal create substantial barriers, and capacity is concentrated in China and Japan, giving the Asia-Pacific region a dominant role. Demand-side qualification cycles from cell

manufacturers are lengthy, but once a supplier is approved, the relationship tends to be durable. Government statistical releases on the new energy sector confirm that sustained lithium battery output provides a solid foundation for SBP-BF4 application. Industry trends indicate the electrolyte additive market is shifting from generic solutions toward function-customized offerings, and the material?s unique fit with high-nickel ternary cathodes and silicon-carbon anodes is unlocking premium value. Annual reports highlight that continuous process refinement and cost reduction are central to broadening adoption. Future growth largely hinges on the certainty of high-voltage battery technology roadmaps and their penetration speed. Overall, the product is transitioning from early commercialization to volume supply, with prospects shaped by technological iteration and supply chain synergies.
